

## How to Run the Kivi Game

1. WelcomeScreen.java is the driver class and Game.jar is the jar file for the Kivi game.
2. In the welcome screen, players will see two options: New Game and Load Game.
3. If the player chooses New Game, it will take them to the Game Setting Screen.
4. In the Game Setting Screen, players can choose between 2 to 4 players, including AI players. AI players can be set to either "Easy" or "Hard" difficulty.
5. For AI players:
  - o Easy AI rolls the dice once and places a stone if a valid tile is found.
  - o Hard AI rolls the dice up to three times and places a stone once a valid tile is found.
6. The main difference between Easy and Hard AI is that the Hard AI will always place a piece, while the Easy AI might not.
7. Players can also choose different Worlds (color deficiency settings) designed to accommodate the three main color vision deficiencies: red, blue, and green.
8. The settings are as follows:
  - o Red = red deficiency
  - o Blue = blue deficiency
  - o Green = green deficiency
9. After the player clicks Start Game, they will be taken to the Board Screen.
10. Players roll the dice by pressing the Roll Dice button.
11. Once the dice values appear, players can select a valid tile and place a stone by pressing the Confirm button.
12. If the selected tile is invalid, an error message will be shown.
13. Valid tiles are not highlighted to maintain the integrity of the game — players should use their own judgment to select tiles.
14. Players must press the **Next Player** button after completing their turn to pass it to the next player. Human players must also press the Next Player button for AI players.
15. The game will close if a player chooses the Quit Game option.
16. Players can press the Save Game button at any point to save the current game state.
17. After all turns are completed, the Winner Screen will be displayed.
18. If the player chooses Load Game from the welcome screen, they will be taken to the Saved Game Screen, where they can select from previously saved games.
